

75mm Swivel and Hauling eye set

This Hauling eye is specifically intended for hauling SA, SAL and SPSA cables through ducts or directionally drilled conduits with an inner diameter greater than 89mm. The connection between the swivel and hauling eye is a simple clevis. The cable is terminated to the hauling eye with conventional crimp ferrules. The safe working load of the unit is 6000kg with breaking strain in excess of 18000kg.

The hauling eye and swivel minimises the number of components required to attach the cable to the hauling line and also streamlines the connection process.
